Description

Giulio told me (Phil) that the wiki has been "flatten" (all pages merged in a single page).

The reason was to be able to export the whole documentation as a single file.

But, it makes editing more difficult, the structure less flexible and more difficult to nagivate, and as the documentation grows the single page becomes heavier and heavier.

I quickly checked and found that Redmine has an option to export all the pages in a wiki as a single document, which should address the initial concern.

See here: https://www.redmine.org/issues/3463. In short, one just needs to go to an index ("Index by title", on the right), then just click one of the option in "Also available in: " (PDF, HTML)

So i suggest that the wiki is re-organized with several, small pages.
