Description			
Dear Philippe,			
I noticed that since 9 november at around 2 pm, the CSR weather station did not store any info on rainfall (I did not check other parameters).			
I will ask Vijai to check the batteries, as we had a couple of overcast days and perhaps the solar charge of the weather station was not enough...			
I think it is better to check also if data have been stored in Ambient Weather server or not.			
Thanks

This morning batteries have been replaced in CSR Weather Station, but it looks like it is not yet working. Additionally, in the Gisaf Home page, Weather Stations dashboard, it looks like none of the 3 weather station is sending data: could be a problem at the Ambient weather side? I wanted to check but it looks like I don't have the correct credentials to log in... kindly check and update me, thanks

#2 - 16/11/2022 15:17 - Giulio Di Anastasio

I checked once again, it looks that Kalpana is actually working...but Sunship and CSR are not... and even Kalpana data in the dashboard stop on the 12th of november...
