**Description**

There was a hectic migration of gisdb to bullseye, postgres 12, postGis 3.

The upgrade-cluster tool didn't work, so i went with re-creating the DB, importing from backup.

But, roles were not set (only avgis). Gisaf frontend works with the new setup.

See the file ~postgres/import_postgres_12_prod_output for the errors.

Also, need to check:

- "cron" jobs
- jupyter
- backups
